investment memo

> **Most AI investments cannot defend their terminal value. Alexandria's compounds with every model release — especially post-singularity.**
>
> *The cognitive layer of AI — where human minds remain machine-readable across the transition.*

the investment.

Most AI products are transition assets — value decays into the model with each release. Alexandria's asset is a **private, accumulating, machine-readable record of how a specific person thinks** — sovereign to the user, unsynthesizable from outside, *worth more from every better model.* The strategic prize is the canonical write path for those records: same shape as WordPress, GitHub, Hugging Face. Winner-takes-most. Technical and survival risks are zero. **The only existential question is demand. That is the only thing capital is for.**

In April 2026 Andrej Karpathy publicly described this architecture — raw data compiled into structured markdown, incrementally enhanced, queries that compound back into the knowledge base — and said "there is room here for an incredible new product." **Alexandria had already shipped it.**

the asset.

A structured record of who each user is — whatever they choose to put in it: worldview, values, mental models, taste, personal thoughts, decisions, blind spots, anything. **The product is the framework; the practice is theirs** (daily Socratic sessions, journals, decision logs, any system works). Local files the user owns. Portable across every AI provider. *The record cannot be back-filled: inbox-scraping reaches what the user does, never what they mean.* **The compounding is the years.**

Engineering is done. One curl command. $10/month floor, free with five referred friends, users choose what they pay above that. The only open question is whether enough people want it.

---

the moat.

Alexandria is sovereign by design — any individual user can take their files and walk at zero cost. ***The defensibility is one layer up: coordination.*** *Alexandria only works as the read* ***and*** *write path for personal thought — writers chase readers, readers chase writers, both terminate on the same place.* Once the network gathers there, displacing Alexandria requires getting everyone to switch at once. That doesn't happen — same as HTTP, SMTP, GitHub, Hugging Face. **The scarce asset in a world of cheap intelligence is not capability; it is coordination.**

1. Convention. *Be the canonical place where people host their cognitive records.* Same shape as *build-it-on-WordPress*, *push-it-to-GitHub*, *host-it-on-Hugging-Face*. **Apple can build the tool; Apple cannot build the cathedral.** *Winner-takes-most. 12–36 month window — move as if 12.*

2. Network. *Your circle on Alexandria means your AI can read their frames when planning with or about them.* The friend's-mind primitive turns recruitment into self-interest. *A clone starts with no population.*

3. Integration. *Every AI tool reading from the user's local Alexandria directory is another terminal point.* Claude Code, Cursor, Codex today; every personalised app tomorrow. **The user can leave; the ecosystem points back.**

---

the business.

Subscription. *$10/month floor; users choose what they pay above that, no cap.* Stands alone. Break-even at 10 paid users.

Platform. *Users grant other services permissioned access to their Alexandria record — opt-in, revocable.* AI labs pay for alignment and personalisation data. Consumer apps pay to know users who want to be known (meditation, therapy, dating, productivity). **The user monetises their own frame; Alexandria captures a clearing fee.** *Independent of subscription count.*

If	Then
~100K paying users × $50/m settled	~$60M ARR
Platform / integration revenue	~$40M+ ARR
Combined at standard 10× SaaS multiple	**$1B+ valuation**

the founder.

Benjamin a. Mowinckel. 26, Norwegian-American. Eton, Princeton, Norwegian military, brief stint at Verdane. Currently in San Francisco. **Solo, running the entire stack on AI agents at $100/month opex, full-time since March 2026.** Two months from zero to engineering-done.

	$/m
Company opex	$100
Founder bare minimum	$500
Founder safe monthly	$5,000

He cannot be price-pressured. He cannot be runway-rushed. *Most AI founders solve engineering problems. Benjamin solves the framing problem.*

"I could be wrong. I doubt it. The company costs $100 a month. If I am wrong, the world loses nothing. If I am right and nobody builds this, the world loses something it did not know it needed. Either way, I am building it."

the ask.

- **Rung 1 — ~$100K.** Buffers SF for ~20 months while the demand experiment runs.
- **Rung 2 — ~$200–500K.** Scales what works. First 1,000 users.
- **Rung 3 — ~$1M+.** Platform pilot for AI labs. First public referee on the cap table.

Capital accelerates the demand experiment — the company does not need the money. The founder builds regardless.

The firm whose name attaches goes on the page about how humans preserved thinking through the AI transition. **America protects the right to think. Alexandria protects the ability.** *Set the angels free.*
